TEAM FRAUDSHIELD AI

NAME OF PROJECT: FraudShield AI

Team Members: Dwaipayan Dutta, Dev Chansoria, Pratham Sahu, Parisa Jain

Problem Statement

AI/ML-Based Classification of Suspicious Mule Accounts

Idea

The idea is to build a binary classification model using the given dataset's relevant parameters and tree based ensemble models.

It should flag accounts with anomalies for fraud or mule accounts which exist in a very small proportion to large databases of accounts and aim for an accuracy above 95% so that it is able to detect all possible target accounts.

Considering such a model can also flag some genuine accounts, a user interface on the part of the bank will also be made so that certain possibilities can be easily reviewed by pointing out the basis of such accounts being flagged.
